#### **MEMBERS**

Mosquera Agila Kerly Estefania

Oña Tupiza Erick Fabricio

Pachacama Tipan Alexander Paul

Ponce Chuqui Camilo Alejandro

Quichimbo Simba Andrea Estefania

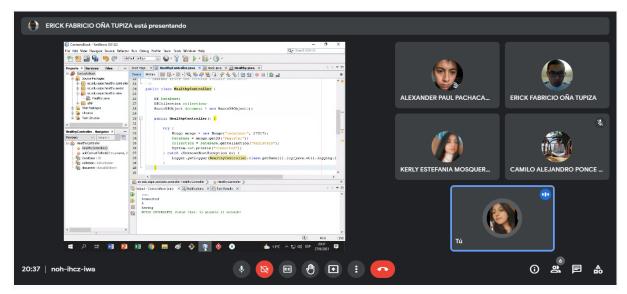

Teacher's name: Jorge Edison Lascano

Sangolquí – Ecuador

#### **HEALTHY HEALTHY**

## **Team report**

We coordinate a meeting in google meet to give ideas and solve the problem the class diagram of the hospital application

## **Objectives**

# **Principal objectives:**

• Identifying the main characteristics of the MongoDB by creating a list of doctors to be able to show said mongo instead of saving the data in tables does it in BSON data structures very similar to JSON with a dynamic system.

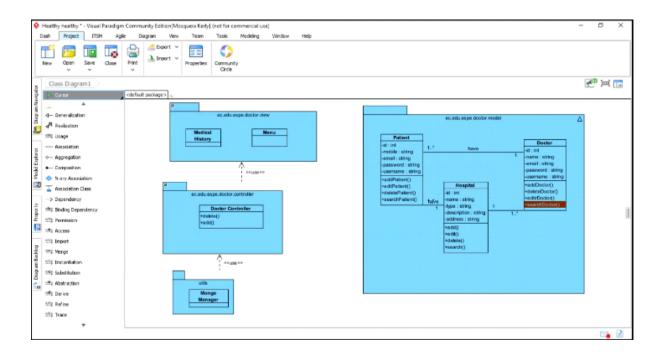

## **Secondaries objectives**

- Carry out a practical application of mongodb within a real problem showing its applicability to daily life.
- Compare the most important differences from mongo db relational databases with similar ones
- Investigate in depth about how mongodb makes a connection in the system in order to be able to apply it in different problems

# Class diagram:

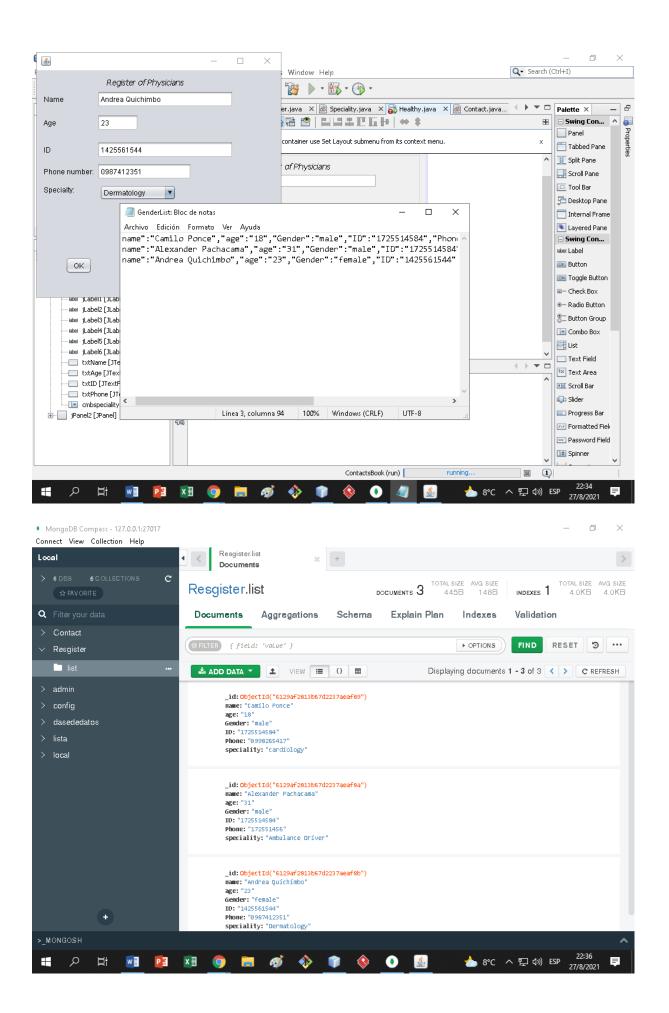

Graphical representation of a class, in which the name of the class, its attributes and methods are specified; It is basically one of the elements of a Class Diagram in which the relationships between the classes are also shown.

The hospital management system class diagram describes the structure of the classes of a single hospital management system, their attributes and operations (or methods), and the relationships between objects. The main classes of the hospital application system are Hospitals, Patients and Doctors.

# **Database (json):**

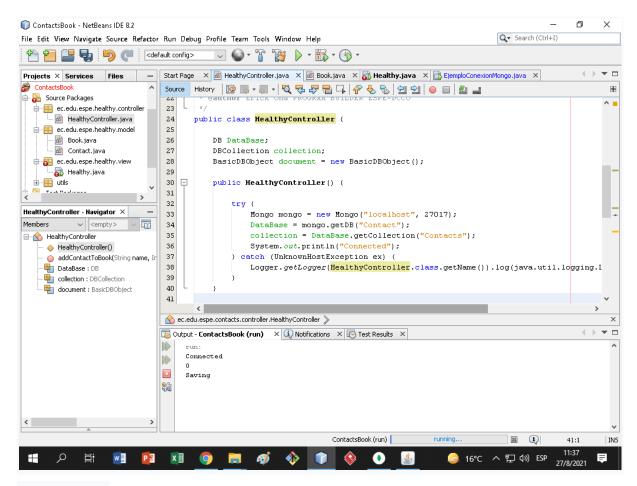

JavaScript Object Notation (JSON) is a standard text-based format for representing structured data in JavaScript object syntax. It is used to transmit data in web applications (for example: send some data from the server to the client, so this data can be displayed on web pages, or vice versa). You will be faced with it often, so this article gives you everything you need to know to work with JSON using JavaScript, including JSON parsing to access the data within it, and how to create JSON.

# **Code:**

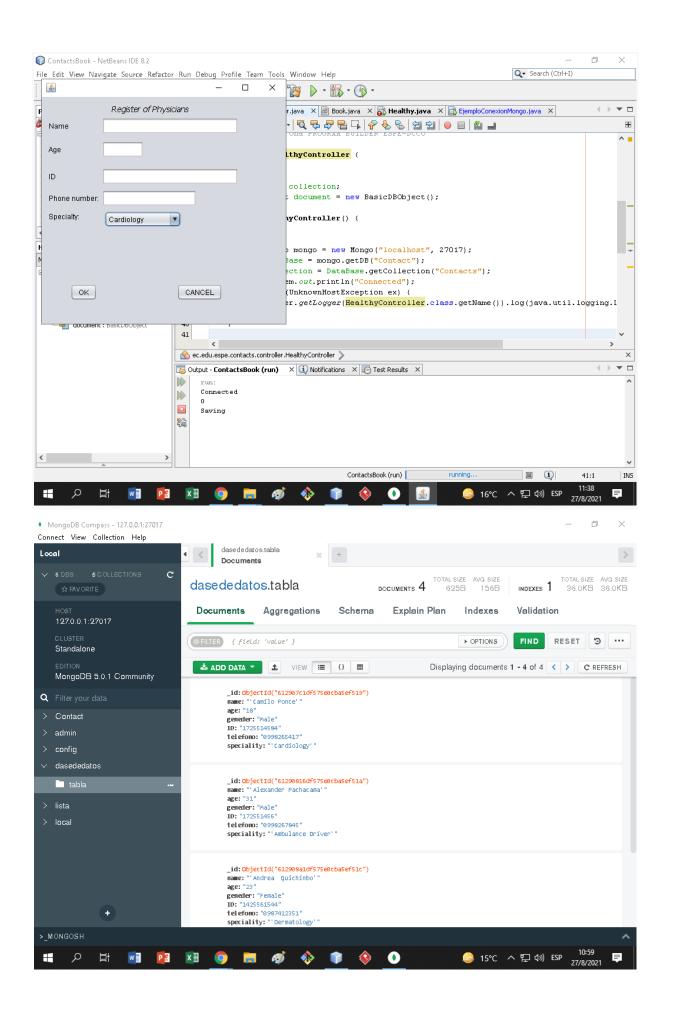

When we talk about programming code we refer to the language with which computers work, it comprises a set of instructions and data to be processed automatically.

Computer code can be binary (interpretable only by computers), source code (interpretable by human beings), and in its legal or political aspect it can be free software, open source, freeware, shareware or traditional proprietary / proprietary software.

# **Execution:**

Execution time is the time interval in which a computer program runs on an operating system. This time begins when the program is put into main memory, so the operating system begins to execute its instructions.

# **Conclusions**

In conclusion, it was possible to determine that the mongodb facilitates us in the creation of an external database because it is not necessary to build a schema, in which the data of a system is saved.
